

TA Solutions

Angular - Nest technical test

Use the currency API to create a currency converter; the converter should utilize the API to allow conversions of all currencies it supports dynamically. Use directives and structured components where possible.

Also, store a record of all the currency conversions done by a user and list them with date and time in the UI. This record should persist even if the website is reloaded.

Important: Use the historical exchange rate endpoint to allow the user to select a date and use the exchange rate at that date in history to convert currencies.

Further details:

1. There should be a dropdown to select the currency for both ends.
2. Should show loaders for any API requests.
3. Should be a mobile-first view. It should be perfect for mobile screens.
4. Currency API must be used from the backend since we cannot use the API key publicly.
5. **Backend should be in Nest JS.**

Libraries required to use:

Angular v19

Angular Material

NestJS

API Documentation: <https://freecurrencyapi.com/docs/>

API key: 4E0VK7BnkdeUuh1vegAt808v2IUjzUR6lxcvBMT2

(Since this is a free API key, there is a chance that it might have completed its limit, in that case please create a new key at the website, its free and straightforward.)

Mandatory Requirements:

1. Please push the code to a public repository on GitHub and share that link to be assessed.
2. Please also deploy this project on [Netlify](#) or any other free web hosting platforms to complete the assignment. Please make sure the deployed website is functioning correctly and is available publicly.

Thank you and best of luck 😊
